

### **Do the Units need cleaning?**

Yes because the unit's mechanism depends on the reflection of light and excessive dirt may therefore hamper the effectiveness of the unit.

### **Are the beams harmful to humans and other animals?**

No. The reflection may be an irritant but it is not harmful.

### **Will it chase away all of the birds?**

No. We do not claim that the Eagle Eye™ unit will chase away all birds. There are always some stubborn persistent birds that refuse to give up their favorite roosting spot. They can only be removed through a culling program or by spiking their roosting/nesting spots. On average up to 80% reduction in bird infestation can be expected.

### **How long will a normal car battery last if that is the power source?**

Up to two months.

### **Can more than one Eagle Eye™ unit work off 1 solar panel?**

Yes, two units can run off a 10W solar panel and five units off a 20W, provided the wire does not exceed 25 meters in length.

### **How long before the birds return if a unit breaks?**

Once a bird has moved to another roosting spot, it will not easily return because it's perching and roosting patterns have been broken.

### **Does it work for all bird kinds?**

No. Most predator birds appear to be unaffected by the units. Further testing on various other bird

species is required. It only affects birds while they are in flight therefore, chickens and ostriches are safe.

### **How do I know how many units I will need for my site?**

1. Follow the spotting and placing guidelines on our website.
2. Photos/plans of your building or problem areas can be sent to our e-mail address and we will gladly assist you in assessing your site.
3. Contact our office via e-mail and we will arrange for a professional consultation if there is one in your area.

*The Eagle Eye bird chaser is the most effective open area bird deterrent in the world today.*

**eagle eye**   
bird control

[www.eagleeye.co.za](http://www.eagleeye.co.za)

- An Optical bird scarer approved and recommended by the Department of Nature Conservation.
- The first bird scarer to harmlessly relocate birds successfully from unwanted areas such as \* Buildings, \* Airstrips, \* Farm lands, \* Silos, \* Golf greens, \* Public Areas, – etc.
- The Eagle Eye™ bird-scarer does not harm the bird in any way.
- Up to 80% reduction in bird infestation within 3 months!!

Manufactured and patented in South Africa, this product is the new revolutionary discovery underwritten by Cape Nature Conservation.

The Eagle Eye™ is the new prototype developed over a period of time and has gone through thorough tests in all areas during this time. We can now with confidence market and support it.

The Eagle Eye™ works by reflecting light beams. The light bands, including the ultraviolet and infrared bands in the light spectrum are reflected back to the bird imitating the presence of a predator bird. This causes the bird to deviate in flight and fly to another destination. It does

not affect sitting birds but hinders the bird at the angle which they come in to land at their destination. Once chased away from their sitting position the bird will eventually not return to where the Eagle Eye™ is installed.

An important aspect of the Eagle Eye™ is that it works in line of sight. If there are obstacles in the way of the beams, more units will be needed to cover the specified areas on the different height levels.

Installation trials should run for at least 3 months, after which bird infestation will be reduced by up to 80%.

***“Using the Eagle Eye Bird-Scarer is an environmentally friendly, cheap and effective way of preventing bird damage on wheat trials”.***

*Dr Francois Koekemoer, Wheat R&D lead, Monsanto, South Africa.*

The Eagle Eye™ is fitted with a 12 volt DC motor to make it turn at a specific speed, reflecting light beams at constant intervals. It can be powered by making use of a 12-volt transformer, a Solar Panel or a 12 volt battery.

A time switch can also be used to switch the Eagle Eye™ on and off as required.

The Eagle Eye™ functions optimally in direct sunlight. Artificial light can be used for indoor application or shady areas but is not as affective as direct sunlight and more units will be needed to cover the same area. (A specific light is required.)

The reflective surface of the Eagle Eye™ is manufactured from a strong ABS plastic material that does not break during hailstorms.

A Service Level Agreement can be entered into with your local agent to keep your Eagle Eye™ turning at all times. The monthly cost per unit is based on a sliding scale, depending on the total number of units bought by the client. This covers all expenses or costs where repair or replacement of the Eagle Eye™ is concerned.

Animal welfare institutions are all in favour of the Eagle Eye™ because it is environmentally friendly, not harmful to any animals or environment and will reduce the infestation of birds by up to 80% within a three-month period.

## Q **uestions and** A **nswers**

### **What happens in cloudy weather?**

As long as the unit has been in use for

long enough to change the birds perching and roosting patterns, then sporadic overcast weather shouldn't influence the effectiveness.

### **Will the birds get used to it?**

No. The Eagle Eye™ unit is specially developed to irritate the light sensitive retina of the bird's eye. It is therefore extremely unlikely that a bird could get used to the concentrated light beams. Birds may however discover the shadow sides and gain access through those approaches. The longer the Eagle Eye™ unit is in place, the better the results.
